I am an economics PhD student looking for an RA to work on a project with me and an incoming professor at Chicago's Harris School of Public Policy. Our project examines the impact of housing debt overhang on consumption and default using household level financial data. We are looking to hire someone for 10 hours per week for the remainder of the semester, and ideally through the summer. We can pay $20/hour. Must have experience doing data analysis in R. If interested, please contact Pascal Noel (noel@fas.harvard.edu), and include your resume, a writing sample describing a data analysis project, and example code from this project.
